Introduction

The main problem

The number of projects being developed has increased significantly in recent years. However, the tools commonly used throughout a project's lifecycle are often fragmented, requiring teams to rely on multiple platforms for communication, task management, and data organization. This separation can reduce efficiency, increase complexity, and generate additional costs due to the need for multiple subscriptions.

As a result, organizations and independent professionals may allocate a considerable portion of their resources to maintaining these services rather than investing in other areas, such as team growth or product development.

Prismaflow was developed to address this issue by providing a unified platform for project management. The system integrates essential project management functionalities into a single environment, enabling teams and freelancers to organize workflows, collaborate effectively, and manage project-related information more efficiently. Its primary objective is to offer a high-quality and cost-effective alternative to the use of multiple disconnected tools.

Prismaflow values

1. **Simplicity:** In Prismaflow, we strive for simplicity without compromising quality, offering simple yet essential products and services for project development. That's why focusing on simplicity while maintaining high quality is so important.
2. **Accessibility:** Accessibility is very important within Prismaflow, because our main audience is freelance programmers, who cannot enjoy many resources, like a company or a work team with a project that already generates these resources.
3. **Efficiency:** Our focus is on maximizing efficiency in our user's project development by eliminating confusing, slow, and sometimes frustrating workflows. This focus is achieved by providing a high-quality, purposeful service.

4. **Transparency:** We promote clear communication, honest practices, and visibility across projects, teams, and business operations.
5. **Innovation:** We continuously improve our platform by adopting new technologies and adapting to the evolving needs of modern teams.
6. **Reliability:** Users depend on Prismaflow to manage critical information and workflows. We are committed to providing a stable and dependable service.
7. **Collaboration:** Great projects are built by people working together. We design our platform to strengthen teamwork and communication.

API

Auth endpoints.

When users tries to sign in or sign up via email or providers the user gets those endpoints:

1. **/auth/login:** This is endpoint only requires password and email for be valid, this is how the json body needs to look:

```
type body = {  
  email: string,  
  password: string  
}
```

And returns:

```
type response = {  
  message: string,  
  token: string  
}
```

2. **/auth/register:** This is endpoint requires password, email and username for be valid, this is how the json body needs to look:

```
type body = {  
  email: string,  
  username: string,  
  password: string  
}
```

And returns:

```
type response = {  
  message: string,  
  token: string  
}
```

3. `/auth/google`, `/auth/github`, `/auth/gitlab`: Doesn't need body, only returns an url typed as **string**, and named **"url"** for user sign in.

Possible auth errors.

Using the auth endpoint you maybe can get some errors, but they have only a type and error status as identifier.

```
type error_response = {  
  message: string,  
  error: string, //Sometimes is all the error variable  
  status: number  
}
```

Error statuses

1. **400 - Bad request:** Bad request means that your request has missing required fields.
2. **500 - Server error:** This problem is mostly caused by the code or a service used in this, in this case [Supabase](#) can be the error. Try taking a look at [Supabase website status](#) to be sure that is the database error.
3. **502 - Supabase error:** This error is a **Supabase** error handled, in this case, the error is from **Supabase Auth** page.
4. **503 - Resend error:** This error only happens in the login page, because when the user signs in **Prismaflow** the endpoint `/auth/login` sends an email via resend.
